TRIFIRE offers fire training solutions that:

- Simulate all relevant fire situations efficiently and realistically.
- Can be used in populated and confined areas under the strictest environmental standards.
- Are easy to use and safe for both instructors and trainees.

TRIFIRE is a small, specialized company which develops and produces fire training equipment. Our aim is to enable successful fire training that meets the many demands of procurement managers as well as instructors and daily users. Long-time customers and satisfied daily users include the Royal Danish Navy, Army and Air

Force, Danish fire brigades as well as fire training facilities in several other countries. Furthermore, TRIFIRE is currently expanding its services into new markets. Constantly living out and respecting our core values and beliefs, we always strive to act responsibly and deliver solutions that build on our extensive expertise – to improve fire training at every opportunity and at all times.

Realistic fire training for everyone

TRIFIRE burners are mobile and use propane gas with hardly any smoke or harmful emissions. This means that you can use them in almost any location, e.g. on board ships, in parking lots, in public squares and in

schoolyards, to make training sessions as realistic as possible.

Basic fire training

TRIFIRE's modular system allows you to simulate all common fires (class A-C). Simply mount one of six different units on the base and you can train putting out fires in pc-monitors, waste disposers, aerosol spray cans, burning oil pots and electric switchboards. You can use all types of fire extinguishers on TRIFIRE equipment: Water, foam, powder and carbon dioxide (CO₂) etc. This means that training sessions allow you to both identify the right type of fire extinguisher and get hands-on experience using it. And with TRIFIRE's small liquid burner you can simulate a liquid fire of up to 1.5 square meters.

Advanced fire training:

For maritime and naval training as well as education of fire fighters, TRIFIRE offers liquid burners in different shapes and sizes, e.g. six square meters or larger. All of them can be tailored to your every need. Furthermore, we can deliver safe and clean burners for “flashover” and “hot door” situations.

Safe and easy too...

All TRIFIRE solutions are designed to be user-friendly. You can quickly ignite and kill the fire by using the remote control. The flames are at all times 100% under control – making it both safe and convenient to use TRIFIRE equipment. In training sessions with many participants, and consequently many fires to

start and put out, this ensures a fast and efficient training.

Environmentally friendly

TRIFIRE solutions for both basic and advanced training use normal bottle gas (propane/butane). It is non-toxic and not an environmental hazard even if released as a liquid or vapor into water, air or soil. Propane is also clean burning. That is why forklifts used indoors throughout the world are propane powered. Combustion does produce greenhouse gasses, but levels are far below that of any readily available carbon-based fuel (diesel/kerosene etc.).

If you need smoke

Smoke can be obtained from our smoke machines. All smoke

is harmless and breathable but yet removes all visibility instantly.

Quality materials

TRIFIRE products are made of first-class stainless steel that boasts high temperature strength and oxidation resistance. All other materials, including electronic valves, batteries, electrical circuits, cables, buttons and pipes are carefully selected to cope with daily use in the field.
